Secure Yourself With Tania

Contents

- 1. Landing Page** - Build Your Future with Cybersecurity
- 2. Dashboard** - Main hub with 6 feature sections
- 3. Email Samples** - 5 realistic phishing email analyses
- 4. Red Flags** - 16 phishing indicator checklist
- 5. URL Analysis** - 6 URL deception techniques
- 6. Prevention** - 7 essential best practices
- 7. If Phished** - 8 emergency response steps
- 8. Summary** - Key takeaways and statistics
- 9. Dark Mode** - Full dark theme support

1. Landing Page

The landing page serves as the first impression of Tania's Cybersecurity Services platform. It features a bold, professional design with a dark emerald gradient background that immediately conveys security and trust. The page opens with the company logo, followed by the prominent heading 'Build Your Future with Cybersecurity' and the tagline 'Secure Yourself With Tania'. A large, eye-catching 'Get Started' button guides users into the main application, creating a smooth entry point into the phishing awareness training experience.

2. Dashboard

The dashboard is the central hub of the application, providing an organized overview of all six feature sections. Each section is displayed as an interactive card showing the section name, item count, and a brief description. Users can click on any card to dive deeper into that specific topic. The dashboard header displays 'Phishing Awareness' as the main title with 'Tania's Cybersecurity Services' as the subtitle, reinforcing the brand identity throughout the application.

Key Features:

- 6 interactive section cards with icons and descriptions
- Dark/Light mode toggle for comfortable viewing
- Quick overview with item counts (5 emails, 16 flags, 6 techniques, 7 practices, 8 steps, 6 takeaways)
- Smooth navigation back to landing page via header click
- Responsive design adapting to all screen sizes

3. Email Samples - Phishing Analysis

This section presents 5 realistic phishing email samples that users can analyze interactively. Each email displays the sender information, subject line, and a suspicious link or email address. Users can click the 'Analyze' button to reveal a detailed breakdown of the phishing indicators present in each email. The emails cover common attack vectors including bank impersonation, password reset scams, lottery fraud, social media verification, and delivery notification phishing. This hands-on approach helps users recognize real-world phishing attempts by examining actual patterns and techniques used by attackers.

Sample Emails Included:

- Bank of America impersonation - verify-account scam link
- Company Corp password reset - employee portal phishing
- International Lottery Awards - claims@fraud-domain
- Instagram Security Verify - fake login page link
- FedEx Delivery tracking - package notification scam

4. Red Flags - Phishing Indicators

The Red Flags section provides a comprehensive checklist of 16 phishing indicators organized into clear categories: Sender, Content, Links, and Urgency. Each indicator is presented with a visual flag and an explanation of why it signals a potential phishing attempt. This categorization helps users systematically evaluate suspicious emails by checking each category. Understanding these red flags is the foundation of phishing awareness, as it empowers users to identify threats before clicking on malicious links or sharing sensitive information.

Categories Covered:

- Sender Indicators - Spoofed addresses, mismatched domains, generic greetings
- Content Indicators - Spelling errors, urgent language, requests for personal data
- Link Indicators - Suspicious URLs, hidden destinations, IP address links
- Urgency Indicators - Time pressure, threats of account closure, immediate action required

Figure 4: Red Flags Checklist by Category

5. URL Analysis - Deception Techniques

URL Analysis teaches users about 6 common techniques that attackers use to manipulate URLs and deceive victims. Each technique is explained with a visual breakdown showing how the deceptive URL differs from the legitimate one. Topics include subdomain spoofing, homograph attacks, URL shorteners, path manipulation, and more. By understanding these techniques, users can inspect URLs before clicking and identify manipulated links that may lead to phishing sites, malware downloads, or credential theft pages.

Techniques Covered:

- Subdomain Spoofing - Using legitimate-looking subdomains to hide the real domain
- Homograph Attacks - Replacing characters with similar-looking Unicode characters
- URL Shorteners - Hiding the true destination behind shortened links
- Path Manipulation - Adding legitimate-looking paths to fraudulent domains
- IP Address URLs - Using raw IP addresses instead of domain names
- Typosquatting - Registering domains with common misspellings of popular sites

6. Prevention - Best Practices

The Prevention section outlines 7 essential best practices that users should follow to protect themselves from phishing attacks. Each practice is presented with a clear title, detailed explanation, and practical implementation guidance. Topics range from enabling Multi-Factor Authentication (MFA) and using password managers, to verifying sender identities and keeping software updated. These practices form a comprehensive defense strategy that significantly reduces the risk of falling victim to phishing attempts.

Best Practices:

- Multi-Factor Authentication (MFA) - Add an extra layer of security beyond passwords
- Password Managers - Use unique, strong passwords for every account
- Email Verification - Always verify the sender's actual email address
- Link Inspection - Hover over links before clicking to check destinations
- Software Updates - Keep all systems and browsers updated for security patches
- Security Awareness Training - Stay informed about the latest phishing tactics
- Incident Reporting - Report suspicious emails to your IT/security team immediately

Figure 6: Prevention Best Practices

7. If Phished - Emergency Response

The 'If Phished' section provides a step-by-step emergency response guide with 8 critical steps to follow if you suspect you have fallen victim to a phishing attack. This section is designed as an actionable checklist that users can follow in real-time during a security incident. Each step includes clear instructions on what to do, who to contact, and how to minimize potential damage. From immediately disconnecting from the internet to changing compromised passwords and reporting the incident, these steps form a comprehensive incident response plan for individuals.

Emergency Steps:

- Disconnect - Immediately disconnect from the internet to prevent further data loss
- Change Passwords - Update credentials for all affected accounts from a secure device
- Enable MFA - Turn on multi-factor authentication on compromised accounts
- Contact Bank - Notify your financial institution if financial data was exposed
- Report the Phish - Forward the phishing email to your organization's security team
- Scan for Malware - Run a full system scan with updated antivirus software
- Monitor Accounts - Watch for suspicious activity on all linked accounts for 30+ days
- Document Everything - Keep records of the incident for potential legal or insurance purposes

8. Summary - Key Takeaways & Statistics

The Summary section distills the entire phishing awareness training into 6 core takeaways supported by critical statistics. This section serves as both a recap and a quick-reference guide, presenting the most important lessons from the platform in an easily digestible format. Key statistics about phishing attack frequency, success rates, and financial impact are included to underscore the real-world importance of cybersecurity awareness. Users can revisit this section anytime for a quick refresher on the essential principles of phishing prevention.

Key Takeaways:

- Phishing remains the #1 attack vector - 91% of cyberattacks start with a phishing email
- Human error is the weakest link - Training and awareness are the best defense
- Always verify before clicking - Take time to inspect links and senders carefully
- Use MFA everywhere - Multi-factor authentication blocks 99.9% of automated attacks
- Report suspicious activity immediately - Early response minimizes damage significantly
- Continuous learning is essential - Phishing tactics evolve, so must your awareness

Figure 8: Key Takeaways and Statistics

9. Dark Mode Support

The application fully supports dark mode through the next-themes library, providing a comfortable viewing experience in low-light environments. The dark theme features a deep slate/navy background with emerald green accents that maintain the cybersecurity branding while reducing eye strain. All components, including cards, buttons, text, charts, and navigation elements, are fully adapted for dark mode with proper contrast ratios. Users can toggle between light and dark modes using the theme switcher button located in the header, and their preference is persisted across sessions.
